

Caribbean broadcasting corporation upgrades MMDS transmitter

Caribbean Broadcasting Corporation in Barbados has upgraded the channelized MMDS transmitter system with two broadband ITX02-1000 transmitters in the 2.5-2.7 GHz band.

The new system is making it possible to substitute channelized transmitters by combining several 64QAM streams into a single output antenna, increasing the channel capacity of the system without the need to add additional channelized hardware.

This system provides multi-channel digital television coverage in Barbados by direct transmission and by feeding a network of repeaters.

This project was implemented by a team of experienced technicians and engineers from CBC with technical support from the Cable AML team.
