

## Considering a Private Cellular Network?

**Private Networks** are becoming a viable alternative to more traditional communication technologies, they offer higher capacity, a better quality of bandwidth, and more secure connections by design. **Private Networks** can be tailored to provide coverage and capacity for a specific purpose, area, or group of users.

**Cable AML** believes that connecting devices with quality broadband enables students to access educational materials, communicate with their peers, and participate in online activities regardless of their location. Additionally, **private cellular networks** can be used to augment coverage in areas on and off campus where traditional Wi-Fi coverage or internet connection may be inadequate, allowing for improved access to online resources and communication tools.
